* STRUCTURE DIAGRAM TOO LARGE FOR DISPLAY - AVAILABLE VIA OFFLINE PRINT *

AB The invention relates to novel oligomers, containing **PNA** units substituted by **phosphonic** acid ester, **phosphonic** acid or carborane functions, and the **PNA** monomers from which the novel oligomers are produced, for use in cancer therapy as boron neutron capture agents (no data). Thus, N4-benzyloxycarbonylcytocylinyl acetic acid, 1,2-dicarbadoecaborane(12)-1-acetaldehyde, N-butoxycarbonylethylenediamine, and 2-isocyano-2,2-(dimethyl)ethyl carbonic acid Ph ester were reacted to give (I; R = (CH₃)₃COC(O); R1 = PhCH₂OC(O); R2 = C₂B₁₀H₁₀; R3 = OH); similarly prepared were I, R, R1, R3 as given; R2 = P(O)(OEt)₂ (II) and I, R, R1 as given, R2 = C₂B₁₀H₁₀; R3 = polymer support (III). Using an automated synthesis routine, and monomers I, II, and III, trimer IV was synthesized.

AB The invention provides compositions and methods for improved hybridization analysis utilizing DNA, RNA, PNA and chimeric oligomers in which one or more purine bases are substituted by a pyrazolo[5,4-d]pyrimidine or by a 7-deazapurine purine analogue. Reduced self-aggregation and reduced fluorescence quenching are obtained when the oligomers are used in various methods involving hybridization. Methods of synthesis, as well as novel synthetic precursors, are also provided.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB Novel peptide nucleic acids and novel linked peptide nucleic acids, form triple stranded structures with nucleic acids. The peptide nucleic acids include ligands such as naturally occurring nucleobases attached to a peptide backbone through a suitable linker. Other nucleobases including C-pyrimidines and iso-pyrimidines can be used as the ligands in Hoogsteen strands to increase binding affinity. Two peptide nucleic acid strands are joined together with a linker to form a bis-peptide nucleic acid. The individual strands of the peptide nucleic acids in the bis compounds can be orientated either parallel or antiparallel to each other.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

include ligands such as naturally occurring nucleobases attached to the
peptide backbone through a suitable linker. Other nucleobases including
C-pyrimidines and iso-pyrimidines can be used as the ligands in
Hoogsteen strands to increase binding affinity. Two peptide nucleic acid
strands are joined together with a linker to form a bis-peptide nucleic
acid. The individual strands of the peptide nucleic acids in the bis
compounds can be oriented either parallel or antiparallel to each other.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB Methods of capture, recognition, detection, identification or quantitation of nucleic acids and diagnostics uses generally are described in which are used: (a) a peptide nucleic acid (PNA) comprising a polyamide backbone bearing a plurality of ligands at respective spaced locations along said backbone, said ligands being each independently naturally occurring nucleobases, non-naturally occurring nucleobases or nucleobase-binding groups, each said ligand being bound directly or indirectly to a nitrogen atom in said backbone, and said ligand bearing nitrogen atoms mainly being separated from one another in said backbone by from 4 to 8 intervening atoms; or (b) a nucleic acid analogue capable of hybridizing to a nucleic acid of complementary sequence to form a hybrid which is more stable against denaturation by

heat than a hybrid between the conventional deoxyribonucleotide corresponding to said analogue and said nucleic acid; or (c) a nucleic acid analogue capable of hybridizing to a double stranded nucleic acid in which one strand has a sequence complementary to said analogue, so as to displace the other strand from said one strand.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.

AB Macromolecules are provided that have increased nuclease resistance, increasing binding affinity to a complementary strand, and that activate RNase H enzyme. The macromolecules have the structure **PNA-DNA-PNA** where the DNA portion is composed of subunits of 2'-deoxy-erythro-pentofuranosyl **nucleotides** and the **PNA** portions are composed of subunits of peptide nucleic acids. Such macromolecules are useful for diagnostics and other research purposes, for modulating protein in organisms, and for the diagnosis, detection and treatment of other conditions susceptible to therapeutics.

CAS INDEXING IS AVAILABLE FOR THIS PATENT.
